Phytochemicals

ABSTRACT

Medicinal plants have assumed greater importance in the recent days, due to the tremendous potential they offer in formulating new drugs which afflict humankind against many diseases. There is now a growing focus on the importance of medicinal plants and the traditional health system is solving the healthcare problems of the world. Most developing countries have viewed traditional medical practice as an integral part of their culture. Medicinal plants have curative properties due to the presence of various complex chemical substances of different composition, which are found as secondary metabolites in one or more parts of the plants. Hence, the present study was undertaken to find out the biochemical analysis of an important medicinal tree *Holoptelea integrifolia* was selected from the Nirmala College campus. The young and the matured leaves were powdered and extracted with the ethanolic solvent. The extracts were subjected to biochemical analysis using standard methods.

Introduction

Medicinal plants are a source of great economic value in the Indian subcontinent. Nature has bestowed on us a very rich botanical wealth and a large number of diverse types of plant grow in different parts of the country. Phytochemicals (from the Greek word 'phyto', meaning 'plant') are biologically active, naturally occurring chemical compounds found in plants, which provide health benefits for humans further than those attributed to macronutrients and micronutrients (Hasler et al., 1999). They protect plant from disease and damage and contribute to the plants colour, aroma and

flavour. In general, the plant chemicals that protect plant cells from environmental hazards such as pollution, stress, drought, UV exposure and pathogenic attack are called as phytochemicals (Gibson et al., 1998). Recently, it is clearly known that they have roles in the protection of human health, when their dietary intake is significant. More than 4000 phytochemicals have been cataloged and are classified by protective function; physical characteristics and chemical characteristics. Biochemical's are essential nutrients and are required by the human body for sustaining life. Carbohydrates and proteins are macronutrients.

Materials and methods

Study area (Fig. 1)

Tamil Nadu is one of the 28 states in India. Its capital is Chennai (Formerly known as Madras) the largest city. Tamil Nadu lies in the southern most part of the Indian peninsula and is bordered by the union territory of Puducherry and the states of Kerala, Karnataka and Andhra Pradesh. Coimbatore is the city in Tamil Nadu, South India. It is the capital city of Kongunadu region and is often been referred to as the Manchester of South India. The Nirmala College is situated in the district of Coimbatore, which has a pleasant climate due to the presence of forests to the north and the cool winds blowing through the Palghat gap in the Western Ghats. The College campus is pollution free and eco-friendly. It is filled with more number of medicinal trees and has a rich Botanical Garden.

Systematic position

Division	:	Phanerogams
Class	:	Dicotyledons
Order	:	Urticales
Family	:	Ulmaceae
Genus	:	<i>Holoptelea</i>
Species	:	<i>H. integrifolia</i> Planch.

Holoptelea integrifolia Planch. is a road side tree (Fig. 2). It belongs to family Ulmaceae which

comprises 15 genera and 200 species. It is commonly known as chilbil, kanju in Hindi, chirivilva, poothigam in Sanskrit, njettaival in Malayalam and India elm tree in English. The plant species originated from pacific island. It is distributed over tropical and temperate region of northern hemisphere. *Holoptelea integrifolia* is considered to be native to Asian-tropical region including India, Nepal, Sri Lanka, Cambodia, Laos, Myanmar, Vietnam and China. It is a large deciduous tree with spreading branches and grows up to 30 to 35m in height and 3m girth. Bark is whitish, yellow grey, covered with blisters, peeling in corky, exfoliate with regular intervals. Leaves are simple, alternate, elliptic ovate, entire glabrous with cordate base, acuminate, nerves 5-8pairs, 5-13cm long and 3.2 to 6.3 cm wide. The bark when cut and the leaves when crushed emit an unpleasant odour. Flowers are polygamous greenish yellow to brown in short racemes or fascicles. In male flowers, 8 stamens and in bisexual flowers 5 stamens are present, basally adnate to tepals, ovary is unilocular and stalked, style very short (2.5 to 4mm) long; stigmas 2 in number. The flower appear at the scars of fallen leaves on tree from February to March. Fruits are one seeded samara, light brown, obliquely elliptic or orbicular, winged and stalked, indehiscent, 2.5 to 3.5 cm long 1.5 to 2.5 cm wide. The fruits are seen during month of April to May. Seeds are small, whitish, kidney shaped, flat samara. Habitat moisture and shady area is favourable for survival. The tree is not frost hardy.

Fig 3: Powdered sample.

The plant *Holoptelea integrifolia* is used traditionally for the treatment of inflammation, gastritis, dyspepsia, colic, intestinal worms, vomiting, wound healing, leprosy, diabetes, hemorrhoids, dysmenorrhoea and rheumatism. Bark and leaves are used as bitter astringent, thermogenic, anti-inflammatory, digestive, carminative, laxative, anti-helminthic, depurative, repulsive urinary astringent and in rheumatism the plant is being used by tribal people for their medicinal properties. Decoction of the leaves is used to regulate fat metabolism, treat ring worm eczema and cutaneous disease. Bark and leaf paste of the plant are applied externally on the white patches or leucoderma. Leaves are also used for treating intestinal cancer. Leaf bud mixed with lime juice and applied externally to affected area for treatment of hair loss by infection and treatment of herpes infection. A handful of bark and leaves ground with 15 pepper seeds, one bulb of garlic in rice washed water (Parinitham et al., 2004).

Biochemical analysis

The biochemical screening of leaves and ethanolic extract of *Holoptelea integrifolia* were analysed by standard methods and shown various biochemical constituents such as protein and carbohydrates/

reducing sugars.

Preparation of ethanolic leaf extract

The young and matured leaves were collected from the *Holoptelea integrifolia* and washed twice in running tap water. The leaves were dried allowed to dry under the shade. The dried leaves were powdered by pulverizer. Fig. 3 shows the powdered leaf material of *Holoptelea integrifolia*. Thirty gram of this powder was extracted with 375 ml of ethanol under Soxhlet apparatus for 24 hours. The collected extracts were used for further analysis. The following parameters were analyzed by the methods:

- Extraction and estimation of total soluble carbohydrate by Anthrone methods (Hedge and Hofreiter, 1962).
- Extraction and estimation of total proteins by Lowry's methods (Mattoo, 1970).

Results and discussion

The leaves of *Holoptelea integrifolia* ethanolic extract showed the presence of carbohydrates and protein (Vinod, 2009). Carbohydrates and proteins are present in both leaves but high amount of carbohydrates are present in the young leaves of *Holoptelea integrifolia*. The ethanolic extract of the leaves of *Holoptelea integrifolia* have significant anti-diarrheal activity and supports its traditional uses in herbal medicine.

The effect of acute exposure of sulphur dioxide on the metabolism of *Holoptelea integrifolia* plants has been observed. The biochemical changes include accumulation of free sugars; especially the reducing sugars in the tissue associated with the deposition of starch, and enhanced acid phosphate in exposed plants (Farooq et al., 1985).

Table 1. Carbohydrates and proteins present in the ethanolic extract of young and old leaves of *Holoptelea integrifolia*.

S. No.	Phytochemicals	HIEE(Y)	HIEE(M)
1	Carbohydrates	++	+
2	Proteins	+	+

(++ indicates strongly present and + indicates moderately present)

HIEE (Y): *Holoptelea integrifolia* ethanolic extract of young leaves

HIEE (M): *Holoptelea integrifolia* ethanolic extract of matured leaves

Table 2. Carbohydrate and protein contents present in the young and matured leaf extract of *Holoptelea integrifolia*.

S. No.	Samples	Carbohydrates (mg/g)	Proteins (mg/g)
1	HIEE(Y)	62.0	27.2
2	HIEE(M)	39.0	19.0

**Fig. 4:** Carbohydrate and protein contents (mg/g) present in the young and matured leaves of *Holoptelea integrifolia*.

Anthrone Method and Lowry's method was used to determine the content carbohydrate and protein respectively. The young leaves of *Holoptelea integrifolia* contain more carbohydrate and protein than the matured leaves. People have to find the way back to natural medicinal herbs. The secondary metabolites are naturally synthesized in all parts of the plant body especially bark, leaves, stem, root, flower, fruits, seeds, etc.

Conflict of interest statement

Authors declare that they have no conflict of interest.
